

JANUARY 2009 **STE** EXAM REVIEW

1. The above graph of ionization energy versus atomic number reveals how difficult it is to ionize noble gases.

- a. Which **noble gas** has the lowest ionization energy? _____
- b. Which **family** of the periodic table has the lowest ionization energies? _____
- c. In which periodic trend would you **not** see the noble gases listed? _____
- d. In the second period (from Li to Ne included), which atom is the smallest? _____

(3 marks each)

JANUARY 2009 **STE** EXAM REVIEW

2. Use dot structures to explain how Ca reacts with Cl to produce calcium chloride.

- Show the reaction using dot structures.
- Now show the ionic product with the charges of each ion.
- Write a balanced chemical equation to show what happened with the appropriate chemical formula for the product calcium chloride.
(3 marks each)

3. Carbon has the ability to bond to itself repeatedly while also bonding to other atoms.
Respect the octet rule in using dot structures to show how **3 carbon atoms** can form **two** different compounds **with hydrogen**. (5 marks each)

4. Atomic masses of elements in the periodic table are due to the relative abundance of isotopes in nature.

Calculate the average atomic mass of an element from the data provided in the table below.

Isotope	Mass number (u)	Natural abundance (%)
1	288	48.89
2	290	37.81
3	295	13.30

(5 marks)

5. Explain the difference between ionic and covalent bonding. Tell me as much as you know. (6 marks)

6. Let's say that the **average atomic mass** of fictitious element X is 315.013. We are told that the isotope with a mass of 313 accounts for 32.9% of all X.

What is **the mass of three moles** of the only other existing isotope?

(5 marks)

7. Calculate molar mass.

- N₂
- CaCO₃
- (NH₄)₂S

JANUARY 2009 **STE** EXAM REVIEW

8. Predict the formula of the compound containing the following ions:

NH_4^+ and PO_4^{-3} (3 marks)

9. What is the charge of the Fe ion in FeSO_4 ? Show work. (4 marks)

10. The density of alcohol ($\text{C}_2\text{H}_6\text{O}$) is 0.76 g/cm^3 . How many molecules are there in 1 cm^3 of alcohol? (5 marks)

11. When lead nitrate, $\text{Pb}(\text{NO}_3)_2$, reacts with a solution of sodium iodide (NaI) a yellow precipitate (lead iodide, PbI_2) is produced.

How many moles of yellow PbI_2 will form if a total of 8.0 grams of NaI react? (5 marks)

12. Glucose, $\text{C}_6\text{H}_{12}\text{O}_6$, is often used by cells as an energy source.

The *balanced* equation for the aerobic breakdown of this sugar is:

If in a reaction, 120.0 grams of $\text{C}_6\text{H}_{12}\text{O}_6$ are oxidized, how many grams of oxygen will be consumed? (6 marks)

13. Many patients became violently sick after swallowing 1.0 grams of a new pill. Most were fine when they ingested slightly less. The active ingredient made up 80% of the pill. If the patients on average weighed 80 kg, find the toxic dose of the active ingredient in mg/kg.

14. What are some of the industrial contaminants that can show up in drinking water?

JANUARY 2009 STE EXAM REVIEW

15. A water sample had 0.1 ppm of the pollutant chlorobenzene. Plants growing on the shores of the reservoir, however, contained 0.9 ppm of the same substance. A blood analysis of frogs revealed they had an even higher concentration of chlorobenzene than the plant.

Explain the difference between *bioconcentration* and *bioaccumulation*.

16. Compared to pH = 5.6, a rain sample at pH = 4.2 is how many times more acidic?
17. What mass of KCl is contained in a 0.5 L sample with a concentration of 0.30 moles/L?
