## Chemistry 534

## A- Extra Arrhenius and Bronsted-Lowry Practice

B- $\quad$ Intro to pH and pOH

1. For each equilibrium, identify one Bronsted-Lowry base for the forward reaction, and do likewise for the reverse reaction.
a)

$$
\mathrm{CH}_{2} \mathrm{COOH}(a q)+\mathrm{H}_{2} \mathrm{O}(l) \rightleftharpoons \mathrm{H}_{3} \mathrm{O}^{+}(a q)+\mathrm{CH}_{3} \mathrm{COO}^{-}(a q)
$$

b) $\quad \mathrm{H}_{2} \mathrm{O}(i)+\mathrm{NH}_{3}(a q) \rightleftharpoons \mathrm{NH}_{4}^{+}(a q)+\mathrm{OH}^{-}(a q)$
2. Given: $\quad \mathrm{HCO}_{3}^{-}(a q)+\mathrm{H}_{2} \mathrm{O}(l) \rightleftharpoons \mathrm{H}_{2} \mathrm{CO}_{3}(a q)+\mathrm{OH}^{-}(a q)$
a) Identify two Bronsted Lowry acids in the following equilibrium.

In World War II Johannes
Nicolaus Brønsted
opposed the Nazis, and in consequence he was elected to the Danish parliament in 1947, but could not take his seat because of illness. Shortly after the election, he died.
b) $\quad \mathrm{CO}_{2}$, when added to water, forms $\mathrm{H}_{2} \mathrm{CO}_{3}$. If the thickness of a chicken egg shell is proportional to the amount of $\mathrm{HCO}_{3}{ }^{-}$in its blood stream, explain whether or not it makes sense to give carbonated water to chickens. ( Assuming of course, that you do want thicker egg shells.)
3. Show how $\mathrm{H}_{2} \mathrm{PO}_{4}^{-2}$ could act as a Bronsted-Lowry base in water.
4. Write an ionic equation to show how $\mathrm{Mg}(\mathrm{OH})_{2}$ acts as an Arrhenius base.
5. a) How many moles of $\mathrm{H}^{+}$will result if 3 moles of $\mathrm{H}_{2} \mathrm{SO}_{4}$ completely dissociate?
b) $\quad \mathrm{H}^{+}$does not really exist as a separate species in water? What then is the true acidic ion produced by something like HCl in water?
6. Recall : $\quad \mathbf{p H}=-\log \left[\mathbf{H}^{+}\right], \quad$ where $\left[\mathrm{H}^{+}\right]=$moles $/ \mathrm{L}$ of $\mathrm{H}^{+}$ $\mathbf{p O H}=-\log \left[\mathrm{OH}^{-}\right], \quad$ where $\left[\mathrm{OH}^{-}\right]=$moles $/ \mathrm{L}$ of $\mathrm{OH}^{-}$ $\mathbf{p H}+\mathbf{p O H}=\mathbf{1 4} \quad$ at $25^{\circ} \mathrm{C}$
a) If 0.034 g of $\mathrm{OH}^{-}$are dissolved in 10.0 L of water, what is the pH of the solution?
b) Which has a lower pH : A solution with $10^{-8} \mathrm{moles} / \mathrm{L}$ of $\mathrm{H}^{+}$? Or a solution with $10^{-9} \mathrm{moles} / \mathrm{L}$ of $\mathrm{OH}^{-}$? Show why.
c) If the pOH keeps decreasing, what is happening to the amount of $\mathrm{OH}^{-}$ dissolved in that solution?
d) If pH keeps increasing, what is happening to the amount of $\mathrm{H}^{+}$or $\mathrm{H}_{3} \mathrm{O}^{+}$ dissolved in that solution?
7. $\quad \mathbf{p H}=-\log \left[\mathbf{H}^{+}\right]$can also be written as $\left[\mathrm{H}^{+}\right]=10^{-\mathrm{pH}}$.
a) If clean rain is supposed to have a pH of about 5.6 , how many times more acidic(how many times more $\left[\mathrm{H}^{+}\right]$) is a rain sample with a pH of 4.2 , close to the average pH of rain falling over Montreal?
b) How many times stronger is an NaOH with $\mathrm{pOH}=2.50$ solution compared to one at 2.75 ?
8. Use the laws of logarithms and the formula from last year : $\left[\mathrm{H}^{+}\right][\mathrm{OH}-]=10^{-14}$ to derive $\mathbf{p H}+\mathbf{p O H}=14$

## Answers

1. a) Bronsted bases: $\mathrm{H}_{2} \mathrm{O}, \mathrm{CH}_{3} \mathrm{COO}^{-}$
b) Bronsted bases: $\mathrm{NH}_{3}, \mathrm{OH}^{-}$
2. $\mathrm{FCO}_{3}^{-}(a q)+\mathrm{H}_{2} \mathrm{O}(l) \rightleftharpoons \mathrm{H}_{2} \mathrm{CO}_{3}(a q)+\mathrm{OH}^{-}(a q)$
a) $\mathrm{H}_{2} \mathrm{O}$ and $\mathrm{H}_{2} \mathrm{CO}_{3}$
b) Yes, adding $\mathrm{CO}_{2}$, which will increase $\mathrm{H}_{2} \mathrm{CO}_{3}$, makes sense. It will encourage the reverse reaction and increase the concentration of $\mathrm{HCO}_{3}{ }^{-}$.
3. $\mathrm{H}_{2} \mathrm{PO}_{4}^{-2}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{H}_{3} \mathrm{PO}_{4}+\mathrm{OH}^{-}$
4. $\quad \mathrm{Mg}(\mathrm{OH})_{2} \rightleftharpoons \mathrm{Mg}^{+2}+2 \mathrm{OH}^{-}$
5. a) $\mathrm{H}_{2} \mathrm{SO}_{4} \rightleftharpoons 2 \mathrm{H}^{+}+\mathrm{SO}_{4}^{-2}$ (assuming complete dissociation, which will only happen if a base forces it to do so)
3 moles of $\mathrm{H}_{2} \mathrm{SO}_{4}\left(2 \mathrm{H}^{+} / 1 \mathrm{H}_{2} \mathrm{SO}_{4}\right)=6$ moles $\mathrm{H}^{+}$
b) $\quad \mathrm{H}_{3} \mathrm{O}^{+}$is the true acidic species (it's your dad, not Santa Claus)
6. a) $\mathrm{pOH}=-\log (0.034 \mathrm{~g}(\mathrm{~mole} / 17 \mathrm{~g}) / 10 \mathrm{~L})=3.70 ; \mathrm{pH}=14-3.70=10.3$
b) $\quad 10^{-8} \mathrm{moles} / \mathrm{L}$ of $\mathrm{H}^{+}: \mathrm{pH}=8$; other one has a pOH of 9 but a pH of 5 , and so is more acidic
c) The concentration of hydroxide keeps increasing with decreasing pOH .
d) If pH keeps increasing, the amount of $\mathrm{H}^{+}$or $\mathrm{H}_{3} \mathrm{O}^{+}$keeps decreasing.
7. a) $10^{-4.2} / 10^{-5.6}=25.1$ times stronger
b) $\quad 10^{-2.5} / 10^{-2.75}=1.78$ times stronger
8. $\left[\mathrm{H}^{+}\right][\mathrm{OH}-]=10^{-14}$

Log both sides:
$\log \left[\mathrm{H}^{+}\right]+\log [\mathrm{OH}-]=\log 10^{-14}$
Multiply equation by -1 :
$-\log \left[\mathrm{H}^{+}\right]-\log \left[\mathrm{OH}^{-}\right]=-\log 10^{-14}$
$\mathrm{pH}+\mathrm{pOH}=14$
