1. 10 points

The human body needs on average 1.03×10^{-2} moles/minute of O₂ for cellular respiration. How many grams of glucose does the human body consume each day? $C_6H_{12}O_{6(s)} + 6 O_{2(g)} \rightarrow 6 CO_{2(g)} + 6 H_2O_{(l)}$.

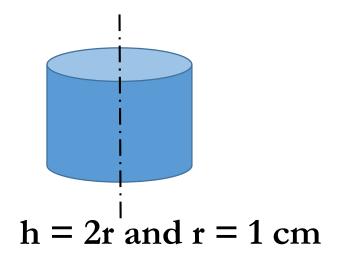

2. 10 points: What's obtained if you calculate the slope of the line drawn? (A) instantaneous rate at t = 500s (B) inst. rate at 0 s (C) average rate over 500s (D) nothing meaningful

Concentration vs Time

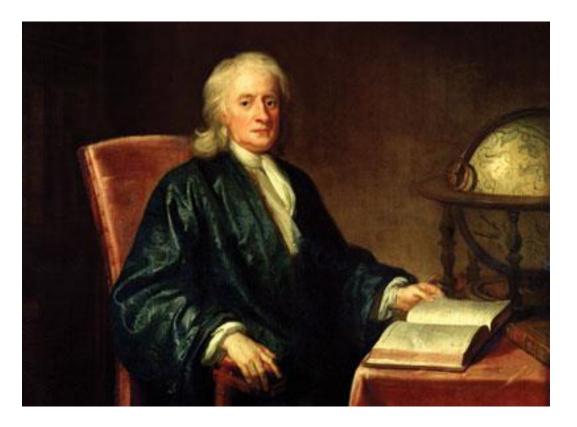

3. Bet 0→15: If you cut the cylinder of Zn as shown, how much faster will it react compared to the uncut cylinder?

$$A_{cylinder} = 2\pi r h + 2\pi r^2$$

4. a) Speed round 10 points (2 quickest answers qualify for calculator duel):

Who is this chemist?

5. 10 points (if the duelists are both wrong question opens up to other teams):

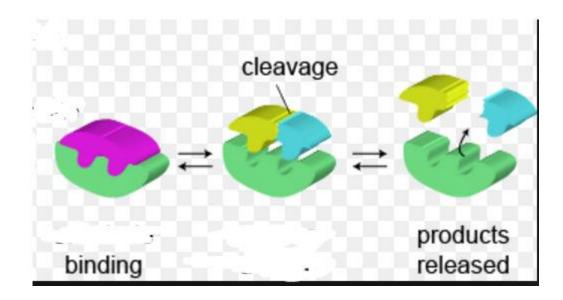

$$R = 8.31 \frac{L \, kPa}{K \, mole}$$

k = Boltzmann's constant = R expressed in

different units = __?__
$$\frac{J}{K \, molecule}$$

6. 15 points

What color is the catalyst in the following reaction?

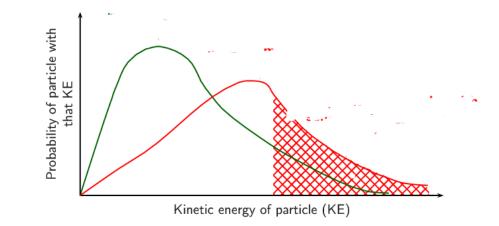

7. Bet $0 \rightarrow 20$ (you have to correctly answer both parts of the question to get the points)

a) What happens to the potential energy of the new activated complex in an catalyzed reaction?

(Goes up?; goes down? Stays the same? Goes to <u>Arizona</u>?)

^{b)} Calculate the A_e for the reverse reaction if $H_{reactants} = 45 \text{ kJ}; H_{activated complex} = 165 \text{ kJ}$ and $H_{products} = 55 \text{ kJ}$

- 8. 25 points(you have to correctly answer all 3 parts of the question to get the points)
 - a) What color is the curve with the highest temperature?
 - b) Redraw the graph but draw and label the activation energy.
- c) On the same graph show an inhibited reaction

9. Bet $0 \rightarrow 30$ points

$$H_2(g) + 2ICl(g) \longrightarrow I_2(g) + 2HCl(g)$$

What happens to the rate of the above overall reaction if you double the concentration of iodine chloride gas (ICl) and triple the concentration of HI? Here is the mechanism:

Slow

Fast
